1.0 INTRODUCTION

This verification plan is prepared in accordance to the requirements of Section 6.0 of the End Item Specification for the Inflight Blood Collection System (EIS IBCS), MSC-06761, and adheres to the guide lines established in Section 6.0 of the Apollo Applications Program, Ancillary Hardware General Requirements, MSC-KA-D-69-44 Revision A.

It defines the specific tests and methods used to verify that the IBCS meets the technical requirements of Sections 3.0 and 6.0 of MSC-06761.

2.0 APPLICABLE DOCUMENTS

The following documents, of the exact issue identified, form a part of this plan to the extent specified herein. In case of conflict, the requirements of this plan will apply.

2.1 STANDARDS

2.1.1 Military

<u>Number</u>	<u>Title</u>	<u>Date</u>
MIL-STD-810B,	Environmental	6-5-67
Notices 1 through 4	Test Methods	9-21-70

2.2 SPECIFICATIONS

2.2.1 NASA

<u>Number</u>	<u>Title</u>	<u>Date</u>
MSC-KA-D-69-44, Revision A	Apollo Applications Program, Ancillary Hardware General Requirements	2-4-70
MSC-06761	End Item Specification For Inflight Blood Collection System (IBCS)	3-30-72

3.0 VERIFICATION REQUIREMENTS

The methods used to verify that the IBCS meets the performance/design requirements of Section 3.0 of MSC-06761 are presented in the Verification Matrix, Figure 1, with references relating each requirement to a specific paragraph of this plan.

The tests used to verify that the IBCS meets the environmental requirements of Section 6.0 of MSC-06761 are presented in the Environmental Test Summary, Figure 2, with references relating each requirement to a specific paragraph of this plan. In addition, the sequence of test activity and elapsed time are illustrated in the Test Activity Flow Chart, Figure 3, and the Elapsed Time Sequence, Figure 4.

3.1 FACILITIES

3.1.1 MDC-East. Verification that the ASP's, centrifuges, syringes, Beta bags, tourniquets, swabs, and BSV's of the IBCS meet the requirements of Sections 3.0 and 6.0 of MSC-06761 will be performed at MDC-East. Test equipment requirements are as follows:

<u>Test Equipment</u>	<u>Purpose</u>
Acceleration Test Stand	Acceleration Test
EMI Test Stand	EMI Test
Environmental Chambers	Altitude, Humidity, Pressure, and Temperature Tests
Functional Test Stand	Operational Evaluation
Microscope	Plasma Analysis
Shock Test Stand	Shock Test
Vibration Test Stand	Vibration Test

3.1.2 Carleton Controls. Verification that the ASPER of the IBCS meets the requirements of Sections 3.0 and 6.0 of MSC-06761 will be performed at Carleton Controls Corporation. Test equipment requirements are as follows:

<u>Test Equipment</u>	<u>Purpose</u>
Acceleration Test Stand	Acceleration Test
Environmental Chambers	Altitude, Humidity, Pressure, and Temperature Tests
Functional Test Stand	Operational Evaluation
Shock Test Stand	Shock Test
Vibration Test Stand	Vibration Test

3.1.3 NASA Center. Preinstallation tests will be performed by the installing contractor or NASA Center. Test equipment requirements are as follows:

<u>Test Equipment</u>	<u>Purpose</u>
Functional Test Stand	Operational Evaluation

3.1.4 Launch Site. Prelaunch tests will be performed at the launch site by the Integrated Systems contractor or NASA Center. There are no test equipment requirements at the launch site.

3.2 VERIFICATION METHODS

3.2.1 Assessment

3.2.1.1 Similarity. Verification by similarity is used when there is a relatively large number of items that are substantially similar or identical in design, manufacturing processes, and quality control to another item that has been previously qualified to equivalent or more stringent requirements. In this plan, it is used in conjunction with other verification methods to

verify that the ASP's, the BSV's, and the syringes meet their applicable technical requirements.

3.2.1.2 Analysis. Verification by analysis is used when a generally accepted analytical technique will verify that an item meets applicable requirements. In this plan, it is used as noted in Figure 1 in lieu of test activity to qualify the IBCS.

3.2.1.3 Inspection. Verification by inspection is used when inspection techniques will verify that an item meets applicable requirements. In this plan, it is used when inspection techniques are adequate to assure that the IBCS meets its technical requirements.

3.2.1.4 Demonstration. Verification by demonstration is used when a simple demonstration will verify that an item meets applicable requirements. In this plan, it is used when an operational and/or functional demonstration is adequate to qualify the IBCS.

3.2.2 Test

3.2.2.1 Development. Development tests, in general, verify the feasibility of a design approach by evaluating hardware failure modes, design margins, performance under simulated or actual environmental conditions and provide confidence in the ability of the hardware to pass qualification tests. In this plan, verification by developmental tests is confirmed by a review of laboratory records.

3.2.2.2 Qualification. Qualification tests verify that Flight Hardware design meets applicable technical requirements to assure operational suitability in anticipated environments. Qualification Test Hardware is identical

in configuration and production processing to Flight Hardware or similar as established in accordance to the requirements of Section 6.2.1 of MSC-06761. In this plan, the qualification test environments and methods of MIL-STD-810, Section 3.0, are used in the Qualification Test Program and are identified in the Environmental Test Summary, Figure 2. In addition, the sequence of test activity is illustrated in the Test Activity Flow Chart, Figure 3. Qualification Test Specification and Qualification Test Procedures will be prepared and approved by MSC prior to the initiation of test activity and a formal report of test results will be submitted for approval at the completion of the Qualification Test Program. Verification by qualification tests is confirmed by the ability of the IBCS to meet the requirements of the Qualification Test Program and by a review of the test results as reported in the Qualification Test Reports. A

The number of test articles that are required for the IBCS qualification and that are deliverable as Qualification Test Hardware is as follows:

- 36 ASP's
- 1 ASPER
- 1 Beta Bag
- 13 BSV's
- 1 Centrifuge
- 36 Syringes
- 2 Tourniquets
- 60 Swabs

A

3.2.2.3 Acceptance. Acceptance tests verify that all hardware meets applicable technical requirements and are acceptable. Each centrifuge and ASPER will be acceptance tested, whereas the ASP's and BSV's will be acceptance tested by sampling 10 percent of each lot. The acceptance test environments are identified in the Environmental Test Summary, Figure 2. A

In addition, the sequence of test activity is illustrated in the Test Activity Flow Chart, Figure 3. Acceptance Test Specifications and Acceptance Test Procedures will be prepared and approved by MSC prior to the initiation of test activity and a formal report of test results will be submitted for approval at the completion of the Acceptance Test Program. Verification by acceptance tests is confirmed by the ability of the IBCS to meet the requirements of the Acceptance Test Program and by a review of the test results as reported in the Acceptance Test Reports. A

3.2.2.4 Preinstallation. Preinstallation tests verify that hardware was not damaged during handling or shipment after the acceptance tests and that its performance capabilities has not deteriorated. In this plan, preinstallation tests are conducted on all end items after receipt for installation by a NASA Center. Verification by preinstallation tests is confirmed by the ability of the IBCS to meet the requirements of the Preinstallation Test Program and by a review of the test results as reported in the Preinstallation Test Reports.

3.2.2.5 Integrated Systems. Integrated Systems Tests verify that hardware, when integrated with mating systems hardware, is functionally and operationally compatible. In this plan, the Integrated Systems Tests are conducted by a NASA Center with contractor input to assure proper storage and installation of the IBCS. B

3.2.2.6 Prelaunch. Prelaunch Tests verify that the integrated flight vehicle systems are ready for launch. In this plan, the Prelaunch Tests are conducted by a NASA Center with contractor input to assure proper stowage and installation of the IBCS. B

3.2.2.7 Other. Not applicable.

3.3 DOCUMENTATION. Documents resulting from this plan are as follows:

3.3.1 Qualification Test Specification

3.3.2 Qualification Test Procedure

3.3.3 Qualification Test Report

3.3.4 Acceptance Test Specification

3.3.5 Acceptance Test Procedure

3.3.6 Acceptance Test Report.

4.0 CONFIGURATION DEVIATION

The end item baseline configuration as established at the Critical Design Review, (CDR), will be changed only through approval of Engineering Change Proposals (ECP) submitted in accordance with Paragraph 8.1.3 of MSC-06761. Where the proposed change recommends modification to this plan and/or MSC-06761, the ECP will be submitted with a preliminary Specification Change Notice (SCN) attached in accordance with Paragraph 8.1.4 of MSC-06761. All ECP's and SCN's will be reviewed and approved by the Manned Spacecraft Center (MSC) prior to their implementation.
